Component of Raline=2006 I Collagen is a member of group I collagen

Component of nearly ubiquitous distribution. Type V collagen binds

COLLEGENIA Trainers of two alpha 1(V) and one alpha 2(V) chains in most tissues and trimers of two alpha 1(V), one alpha 2(V), and one alpha 3(V) chains in placenta.

T. "Concerted modulation of alpha 1(XI) and alpha 2(V) collagen mRNAs in

"Concerted modulation of alpha 1(XI) and alpha 2(V) collagen mRNAs in

bovine vascular smooth muscle cells.";

L. J. Biol. Chem. 266:232766-23271 (1991).

C. -! FUNCTION: May play an important role in fibrillogenesis by

controlling lateral growth of collagen II fibrils.

C. -! SUBUNIT: Trimers composed of three different chains: alpha 1(XI),

alpha 2(XI), and alpha 3(XI). Alpha 3(XI) is a post-translational

modification of alpha 1(II). Alpha 1(V) can also be found instead

of alpha 3(XII=1(II) (By similarity).

C. -! PTM: Prolines at the third position of the tripeptide repeating

c. unit (G.X-Y) are hydroxylated in some or all of the chains.

C. -! SIMILARITY: BELÖNGS TO THE FIBRILLAR CLASS OF COLLAGENS.

R family with Strickler syndrome type 2 has a mutation in the COLIIA1

ST Gener resulting in the substitution of glycine 97 by valine in

RI alpha-1(XI) collagen.";

RL Hum. Mol. Genet. 5:1339-1343(1996).

CC -!- FUNCTION: May play an important role in fibrillogenesis by controlling lateral growth of collagen II fibrils.

CC -!- SUBUNIT: Trimers composed of three different chains: alpha 1(XI),

CC alpha 2(XI), and alpha 3(XI). Alpha 3(XI) is a post-translational modification of alpha 1(II). Alpha 1(V) can also be found instead
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. The rendon.

The rendon.

The the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

"In ISEASE: Defects in COL1A1 are the cause of Stickler syndrome type 2 (STL2) [MIM:604841]; also known as Stickler syndrome type 2 (STL2) [MIM:604841]; also known as Stickler syndrome of vitreous type 2, or beaded vitreous type, due to the presence of irregularly thickened fiber bundles throughout vitreous cavity. Stickler syndrome (hereditary progressive arthro-ophthalmopathy) is an autosomal dominant disorder characterized by progressive myopia beginning in the first decade of life, vitreo-retinal degeneration, retinal detachment, cleft palate, midsacial degeneration, retinal detachment, cleft palate, midsacial hypoplasia, osteoarthritis, and sensorineural hearing loss.

"In ISEASE: Defects in COL1A1 are the cause of Marshall syndrome [MIM:194780], an autosomal dominant disorder with ocular, orofacial, auditory and skeletal manifestations. It shares several features with Stickler syndrome, such as midfacial hypoplasia, high myopia, and sensorineural-hearing deficit.

"In SIMILARITY: BELONGS TO THE FIBEILLAR CLASS OF COLLAGENS.

"In SIMILARITY: HIGH, TO ALPHA 1(V) AND ALPHA 3(V) CHAINS.

"In SIMILARITY: HIGH, TO ALPHA 1(V) AND ALPHA 3(V) GMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Event-Alternative splicing, Named isoforms=1,
Comment-Additional isoforms seem to exist. There is alternative
usage of exon IIA or exon IIB. Transcripts containing exon IIA
or IIB are present in cartilage, but exon IIB is preferentially
utilized in transcripts from tendon;

Tsecific alpha 2(XI) collagen gene expression in the embryonic mouse cartilage.";

J. Cell Biol. 114:1573-1582(1996).

-!- Cell Biol. 114:1573-1582(1996).

-!- FUNCTION: May play an important role in fibrillogenesis by controlling lateral growth of collagen II fibrils (By similarity).

-!- SUBUNT: Trimers composed of three different chains: alpha 1(XI), alpha 2(XI), and alpha 3(XI). Alpha 3(XI) is a post-translational modification of alpha 1(III). (By similarity).
                                                                                                                                                                                                                                                                                                        GERGPRGITGKPGPKGNSGGDGPAGPPGERGPNGPQGPTGFPGPKGPPGKDGLPGHP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DISEASE: Defects in COLIIA2 are the cause of Stickler syndrome type 3 (STID) [WIM:184840]. STL3 is an autosomal dominant disorder characterized by oro-facial, auditory and skeletal manifestations, such as midfacial hypoplasia, cleft palate, osteoarthritis, and sensorineural hearing loss. Differently from Stickler syndrome type 1 and 2, no ocular involvement is observed. This disorder is also referred to as Stickler-like syndrome or non-ocular Stickler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                heteroxygous OSMED.

DISEASE: Defects in COLILA2 are the cause of autosomal dominant nonsyndromic sensorineural deafness type 13 (DFNA13) [MIM:601868].

Affected individuals experience progressive hearing loss beginning in the second to fourth decades, eventually making use of semplification mandatory.

SIMILARITY: BELONGS TO THE FIBRILIAR CLASS OF COLLAGENS.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DISEASE: Defects in COL11A2 are the cause of autosomal recessive otospondylomegaepiphyseal dysplasia (OSMED) [MIM:215150], a skeletal dysplasia accompanied by severe hearing loss. The phenotype overlaps that of autosomal dominant skeletal disorders (Stickler and Marshall syndromes) but can be distinguished by disproportionately short limbs and lack of ocular involvement. DISEASE: Defects in COL11A2 are the cause of Weissenbacher—Zweymueller syndrome (WZS) [MIM:277610], an autosomal dominant disorder allelic with STL3 and OSMED. WZS is also referred to as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DATABASE: NAME=Hereditary hearing loss homepage; NOTE=Gene page; WWW="http://www.uia.ac.be/dnalab/hhh/".
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
-!- PTM: A disulfide-bonded peptide called proline/arginine-rich protein or PARP is released from the amino terminus during extracellular processing and is subsequently retained in the cartilage matrix from which it can be isolated in significant

Biol. Chem. Hoppe-Seyler 373:69-75(1992).
-!- FUNCTION: Type V collagen is a member of group I collagen
-!- FUNCTION: Type V collagen). It is a minor connective tissue
component of nearly ubiquitous distribution. Type V collagen binds
to DNA, heparan sulfate, thrombospondin, heparin, and insulin.
-!- SUBUNIT: Trimers of two alpha 1(V) and one alpha 2(V) chains in
most tissues and trimers of one alpha 1(V), one alpha 2(V), and
one alpha 3(V) chains in placenta.
-!- PTM: Prolines at the third position of the tripeptide repeating
unit (G-X-Y) are hydroxylated in some or all of the chains.

I (III) CB9B (positions 928-1028).";

A Collagen type II cocurs in most soft connective tissues along with type I collagen.

I C - STBUNIT: Trimers of identical alpha I(III) chains. The chains are along with type I collagen.

Inked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.

Inked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.

Inter (G-Y) are hydroxylysines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nidogen.

-!- SUBUNIT: There are six type IV collagen isoforms, alpha 1(IV)-
alpha 6(IV), each of which can form a triple helix structure with
2 other chains to generate type IV collagen network.
-!- DOMAIN: Alpha chains of type IV collagen network.

-!- DOMAIN: Alpha chains of type IV collagen network domain (NCI) at their C-terminus, frequent interruptions of the G-
X-Y repeats in the long central triple-helical domain (which may cause flexibility in the triple helix), and a short N-terminal
C triple-helical TS domain.

-!- PTM: Prolines at the third position of the tripeptide repeating
unit (G-X-Y) are hydroxylated in some or all of the chains.
-!- PTM: Type IV collagens contain numerous cysteine residues which
c are involved in inter- and intramolecular disulfide bonding 12 of these, located in the NCI domain, are conserved in all known type
IV collagens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Yamaguchi N., Benya P.D., van der Rest M., Ninomiya Y.;

The cloning and sequencing of alpha I(VIII) collagen converse that type VII collagen is a short chain collagen and contains triple-helical and carboxyl-terminal non-triple-helical of contains similar to those of type X collagen.";

J. Biol. Chem. 264:16022-16029(1989).

-I- FUNCTION: Type X collagen is a product of hyperthrophic chondroteocytes and has been localized to presumptive mineralization zones of hyaline cartilage.

-I- SUBBNIT: Homotrimer.

-I- PTW: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

-I- SIMILARITY: STRONG, TO ALPHA 1 AND 2 TYPE VIII COLLAGENS.
                                                                                                   Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Nucleic Acids Res. 11:2733-2744(1983).
-!- FUNCTION: Collagen type III occurs in most soft connective tissues along with type I collagen.
-!- SUBUNIT: Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.
-!- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. -!- FUNCTION: Collagen VI acte as a cell-binding protein.

-!- FUNCTION: Collagen VI acte as a cell-binding protein.

-!- SUBUNIT: Trimers composed of three different chains: alpha 1(VI),

-!- PTM: Profines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.

  collagen minas.";
Biochim. Biophys. Acta 1089:241-243(1991).
-!- FUNCTION: Collagen type III occurs in most soft connective tissues along with type I collagen.
-!- SUBUNIT: Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.
-!- PTM: Proline residues at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the
   PTM: O-linked glycan consists of a Glc-Gal disaccharide bound to the oxygen atom of a post-translationally added hydroxyl group (By
